Introduction

Masoneilan's® 72000 Series energy management and low noise products are specifically designed for applications with large mass flow rates and high differential pressures. Typical installations may be found in compressor surge control, gas to flare, atmospheric vent, or other applications where the ratio of inlet/outlet pressures require substantial levels of noise attenuation and large valve sizes. A variety of options and configurations are available to create effective solutions for our customers' specific applications.

The 72000 Series is a valve solution engineered to meet a client's need. As such, the exact product configuration may differ from the general specifications, dependent upon the application. For additional information contact your local Masoneilan Sales representative.

The 72000 Series Control Valve may be custom engineered to fit an application. The data within this catalog is representative of typical configurations and does not include all potential design options.

Product Features

Engineered – Best Fit – Solutions

At Masoneilan we believe our customers deserve the Best Fit solution for their severe service valve applications. Our broad product portfolio and valve trim technologies allow an uncompromising approach in addressing a client's need, and therefore, each 72000 Series valve is engineered to meet a customer's exact specifications and application conditions. This allows us to offer the most technically advanced and cost-effective solution to your energy management and noise control applications.

Low Noise Trim

The Masoneilan Best Fit approach allows for the widest range of noise attenuation options, providing the desired noise level at the lowest cost of ownership. These attenuation products range from single and double stage Lo-dB® trim or up to as many as 40 stages of 3-dimensional V-LOG® tortuous path trim. The selected trim option is always custom engineered to provide best results for each unique application.

Single and double stage Lo-dB trim is selected in most low to moderate pressure drop ratio applications. This technology is customized by modifying the size and spacing of each hole drilled into the cage to provide a minimal sound pressure level at the trim exit.

The 3-dimensional tortuous path design of Masoneilan's V-LOG trim controls pressure reduction through the management of the process fluid energy. This is accomplished by directing the gas through discrete flow channels that are designed with multiple stages consisting of 90-degree turns along with the intermediate contractions and expansions in the flow area. The enhanced flow geometry of the V-LOG trim creates a series of kinetic energy losses, followed by partial energy recoveries at each stage. This gradual letdown process is highly effective for noise attenuation due to the staged reduction of the fluid's pressure.

Large Pressure Drop – Energy Management

Process applications that require the 72000 Series design often experience extremely high pressure drop ratios (P_1/P_2). These high ratios release large amounts of energy as the process fluid's pressure is reduced. This energy release can lead to excessive noise and vibration if not properly addressed in the valve design.

The 3-dimensional tortuous path design of Masoneilan's V-LOG® Trim controls pressure reduction through the management of process fluid energy. This is accomplished by directing the gas through discrete flow channels.

Product Features (cont.)

The labyrinth flow path of the V-LOG Trim subjects the gas to a high level of friction as it is redirected through each turn in the flow path. V-LOG's patented flow contractions produce maximum flow resistance.

The enhanced flow geometry of the V-LOG trim creates a series of kinetic energy losses, followed by partial energy recoveries at each state. This gradual letdown process is highly effective for noise attenuation due to the staged reduction of the fluid pressure.

Each stage of the V-LOG trim is designed with an expansion in flow area, which is essential for managing fluid velocity that would otherwise increase as the pressure is reduced across each stage. The expanding area is designed to compensate for the volumetric expansion of the gas, preventing any increase in the kinetic energy as the pressure is reduced.

Trim velocity control is important for maintaining low aerodynamic noise levels within the valve body and trim. High velocity trim exit flow will yield high magnitude sound waves, which lead to valve body vibration in high-pressure letdown applications.

As a gas experiences a large reduction in pressure, the volume of the gas expands. This phenomenon will yield a higher downstream velocity if the piping is designed without considering this volumetric expansion. Masoneilan's 72000 Series is designed with expanded outlet areas to accommodate this expansion, and minimize the overall system noise level.

** Masoneilan considers both outlet mach number and the outlet expansion ratio for system noise calculation, per the IEC International Noise Predication Standard (IEC-60534-8-3).*

High Capacity

Masoneilan has developed flexible, automated design tools for the 72000 Series line, allowing "ground up" fabrication of custom engineered valve solutions in very short lead times. High capacities and custom C_v s are met through a wide range of valve plug diameters, stroke lengths, and body gallery diameters to suit any application within standard product lead times.

Balanced Plug

Balanced plug designs deliver stability with smaller actuator thrust requirements, as compared to unbalanced designs. Normally, the 72000 Series valves are installed in a flow-to-open configuration allowing radial expansion from the smaller diameter cage to the expanded area of the valve body. The free expansion of the fluid and precise separation of the trim exit flow jets, maximize trim noise attenuation and minimizes vibration within the valve body. For installations that require flow-to-close configurations, an auxiliary pilot plug may be supplied to reduce actuator thrust requirements.

Ease of Maintenance

Top entry trim allows easy access to the valve internals for lower life cycle costs and easier maintenance activity. Masoneilan provides ample padeyes and tapped holes for standard lifting and handling equipment, eliminating the need for special fixtures or tooling. All trim components are cage guided, with ample clearance at the body, bonnet, and bridge regions for ease of removal and replacement. The 72000 Series design employs a minimum number of gaskets and soft goods, making outage planning and stocking requirements easier.

Selection Instructions

Specifying an energy management or low noise product involves sound engineering judgment and application understanding. Masoneilan has developed a computer-based valve sizing and selection program to aid our application specialists in choosing the correct product. Each 72000

Series valve is specified with the Best Fit number of turn or stages according to the noise requirements and pressure drop ratio. Please contact your local Masoneilan representative for application assistance.

Accessories and Options

For complete information and specifications on the following contact your Masoneilan Representative.

Actuation/Instrumentation

- Higher Thrust Pneumatic Cylinders up to 1,000 square inch effective area
- Electric Actuators
- Hydraulic manual override for pneumatic piston actuators
- Dust boot for plug/actuator stem
- Fast response package for quick opening times
- Smart Systems/On line diagnostics

Valve

- Other body materials
- Special end connections
- Special trim materials
- Custom trim characterization
- Body drain plug
- Extension bonnets

Documentation and Test

- Nondestructive examination
- Response verification
- Certified material test reports
- Flow testing (through 8" outlet only)
